ø

The invention relates to human PRO secreted/transmembrane polypeptides (ABR69963-ABR70267) and nucleic acids encoding them (ACC90994-ACC91298). The invention also relates to sequences at least 80% identical to the PRO nucleic acid and polypeptide sequences of the invention, recombinant recombinant recombinant recombinant production of a PRO polypeptide, and tubinant production of a PRO polypeptide, and fusion proteins comprising a PRO polypeptide. Nucleic acids encoding PRO polypeptides of the invention were initially acids encoding PRO polypeptides of the invention were initially acids encoding PRO polypeptides of the invention were initially libraries containing sequences from known secreted proteins. Human cDNA libraries containing sequences of interest were identified using consensus sequences based on the consensus sequences, and CDNA clones were isolated and characterised. The PRO polypeptides are useful for stimulating release of tumour necrosis factor-alpha (TNF-alpha) from chuman blood and may thus be used in the treatment of conditions in which channel the proliferation or differentiation of chondrocytes and as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    29-APR-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               02-JUN-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        21-APR-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      24-NOV-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               09-APR-1
           cuch may be used in the treatment of various bone and/or cartilage
disorders such as arthritis and sports injuries. The PRO polypeptides may
be used in a method for detecting the presence of a tumour (e.g., an
adrenal tumour, lung tumour, colon tumour, breast tumour, prostate
tumour, rectal tumour, cervical tumour niver tumour) in a mammal. This
tumour involves comparing the level of expression of the PRO polypeptide
in test and control samples, where a higher level of expression of PRO
colypeptide in the test sample as compared to the control sample is
indicative of the presence of a tumour. The PRO polypeptides are
additionally useful for in drug screening to identify agonists and
antagonists of PRO polypeptides. PRO nucleic acids are useful as
thyridisation probes (for isolation of cDNA molecules), in chromosome and
con mapping, in the generation of antisense RNA and DNA and in gene
therapy. The nucleic acids can also be used for mapping genes encoding
con mapping, in the generation of antisense RNA and DNA and in gene
therapy. The nucleic acids can also be used for mapping senescic
disorders, and for genetic analysis of individuals with genetic
animals which are useful in the development and screening of
the rapecular ly useful compounds. Sequences ABR6963-ABR70267 represent
the human PRO secreted/transmembrane polypeptides of the invention. Note:
The sequence data for this patent is also available in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FRDFRPLKDSRFQLLNFSSSELKVSLTNVSISDEGRYFCQLYTDPPQESYTTITVLVPPR 145

```
The invention relates to human PRO polypeptides (secreted and transmembrane polypeptides) and the polynucleotides encoding them. The invention also relates to an antibody that specifically binds to a PRO polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNF-alpha) from human blood by contacting the blood with a PRO polypeptide and a method for stimulating the proliferation or endoacocyte cells by contacting the blood with a PRO polypeptide. The polypeptides and polynucleotides are useful for detecting the presence of a tumour, such as an adrenal, lung, colon, polypeptide. The polynucleotides are useful as hybridisation probes, in tumours and gene mapping and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. Sequences ABOO1741 represent human PRO polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequence.html
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Three hundred and five nucleic acids encoding secreted and transmembrane polypeptides, designated as PRO, useful for detecting the presence of, or treating tumor, e.g. adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gurney AL;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Godowski PJ,

This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation the European Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is in no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/amnounce/or send an email to license@isb-sib.ch).
 -!- FUNCTION: Transcription factor. Interacts specifically with the W box (5'-(T)TGAC(C/T)-3'), a frequently occurring elicitor-responsive cis-acting element (By similarity).
-!- SUBCELLULAR LOCATION: Nuclear (Probable).
-!- SIMILARITY: Belongs to the WRKY group I family.
-!- SIMILARITY: Contains 2 WRKY domains.

"Molecular cloning of an 1-aminocyclopropane-1-carboxylate synthase
from sensecing carnation flower petals.";
Plant Mol. Biol. 18:377-386(1992).
-!- FUNCTION: Catalyzes the formation of 1-aminocyclopropane-1-
carboxylate, a direct precursor of ethylene in higher plants.
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine = 1-aminocyclopropane-
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine = 1-aminocyclopropane-
-!- COFACTOR: Pyridoxal phosphate.
 Gaps
 -!- PATHWAY: Ethylene biosynthesis; first (rate-limiting) step.
-!- SUBUNIT: Homodimer.
-!- SIMILARITY: Belongs to the class-I pyridoxal-phosphate-dependent

cells and displays homology to adhesion molecules, B7-1 and cytoplasmic region of B7-11. Mouse LDCAM. Is found on lymphoid derived dendrificated in and displays homology to adhesion molecules, B7-1 and cytoplasmic region of B7-11. Mouse LDCAM is found on whole embryo, testes, triple negative cells murine splenic and lymph node CD8+, S49.1 and dendrification. BCAM polypeptides interacts with T cell surface molecules to alter signalling and inhibits T cell proliferation, bind to themselves and B7L-1, an LDCAM binding protein and increases natural killer (MK) cell populations. It may be used to measure the biological activity and a quality control reagents of LDCAM binding proteins. LDCAM may be used for treating disorders associated with malfunctioning of immune system, inflammation, autoimmune disorders, viral infected cells, infectious diseases and for killing tumour cells. They are also useful for prevention or reducing the effect of corgan and bone marrow transplant rejection and for modulating T cell immune responses. LDCAM polypoptides may also be used as carriers for delivering agents attached to T cells or present amino acid sequence is the mouse lymphoid derived dendrtitic Claim 7; Page 46-47; 44pp; English.

The present invention relates to 12 secreted human proteins and the nucleotide sequences encoding them. The polynucleotide sequences given in AAA806061-480623 encode the 12 secreted protein sequences given in AAA806061-480623 encode the 12 secreted proteins have various activities dependent on the tissues in which they are expressed. Examples of the cativities of the proteins include: immunosuppressant, anti-inflammatory; antiarthritic; antirheumatic, dermaclogical; antiproliferative; antiarthritic; antirheumatic, dermaclogical; antibroliferative; antiarthrity. The proteins, polypeptides, agonists and antiproliferative; antagonists may be used to treat prevent and/or diagnose various disease, disorders and conditions examples of which include: immune disorders e.g. clasoris disease, the unatoid arthritis, dermatitis, and multiple clerosis; inflammatory disorders e.g. inflammatory bowel disease, crohn's disease and nephritis; hyperproliferative disorders such as paraproteinaemias and purpuras; cancer e.g. melanoma and lymphoma. The proteins and polymucleotide sequences may also be used in wound healing and the treatment of infectious diseases. The human secreted protein gene
 Isolated nucleic acid molecules encoding human secreted proteins are used for the prevention, amelioration and treatment of autoimmune, inflammatory, hyperproliferative and cardiovascular disorders, cancer, wounds, and infectious diseases.

having the activity). The polypeptides, nucleic acids and antibodies are useful for diagnosing a pathological condition or a susceptibility to a pathological condition, for preventing, treating, or ameliorating a medical condition, such as cancer, inflammation and other immune disorders, neurological and blood clotting disorders (many examples are given in the specification). The nucleic acids are also useful for chromosome identification, radiation hybrid mapping or long-range restriction mapping. The polypeptides and antibodies are useful for providing immunological probes for differential identification of the tissues immunohistochemistry assays. The polypeptide, polynucleotide, agonist or antagonist may also be used as a food additive or preservative to increase or decrease storage capabilities, fat content or other nutritional components. The present is a secreted protein of the

The invention relates to an isolated nucleic acid sequence, or its altalic variant, a fragment of the cDNA sequence, or its fragment domain, epitope or species homologue. The nucleic acid is useful for preparing a medicament for preventing, treating or ameliorating a medical condition e.g., cancer, liver disorders such as hepatitis or neural disorders such as Alzheimer's disease. The present sequence represents the amino acid sequence of a novel human secreted protein.

 New polynucleotides encoding secreted human proteins, derived from adult placenta, adult retina, fetal brain, fetal.
The present invention provides the protein and coding sequences of nove proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomato. These were derived from expressed sequence tags (EST from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a

The present invention describes new human secreted proteins which were isolated from adult placenta, adult retina, foetal brain, foetal kidney, adult blood, adult brain, adult thyroid, adult blood adult brain, adult thyroid, adult blood adult hereis.

I sissue, adult testes, and adult lymph node cDNA libraries. The human secreted proteins, and the polynucleotides encoding them, are predicted treating, preventing or ameliorating make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals. Suggested activities include nutritional activity, cytokine and call proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, haematopoiesis regulating activity, issue growth activity, activin/inhibin activity, cadherin/tumour ceptor/ligand activity, anti-inflammatory activity, cadherin/tumour function activity. The polynucleotides are also stated to be useful for gene therapy. AAX3316 to AAX3373 encode human secreted proteins, and AAX52998 to AAX5360 crepresent human secreted proteins, given in the present invention

Sequences AAU29024-AAU29328 represent PRO polypeptides of the invention. The PRO polypeptides and their associated nucleic acids can be used to detect the presence of a tumour in a mammal by comparing the level of detect the presence of a tumour in a mammal by comparing the level of and a control sample of normal cells, whereby a higher level of expression of a PRO polypeptide in a test sample of cells from the animal mammal. Mammals include dogs, cats, catle, horses, sheep, pigs, goats and rabbits but are preferably human. The polypeptides can be used to stimulate tumour necrosis factor (TNF) alpha release from human blood, when contacted with it. A specific polypeptide can be used to stimulate the proliferation or differentiation of chondrocyte cells. The PRO proteins can be used to determine the presence of tumours and also susceptibility to tumour development, particularly adrenal, lung, colon, creast, prostate, rectal, cervical, or liver tumours, in mammalian subjects. The oligonucleotide probes specific for the PRO nucleic acids can be used for genetic analysis of individuals with genetic disorders
 Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumors, such as prostate and breast tumors, in mammals and to screen for modulators of the compounds.

```
The invention relates to an isolated PRO polypeptide (a secreted or transmembrane protein) comprising: (a) at least 80% sequence identity or positives when compared to any of 15 sequences, fully defined in the specification, lacking or with itse associated signal peptide; or (b) at least 80% sequence of any defined in the American Type Culture coding sequence of a DNA deposited in the American Type Culture Collection (ATCC). Also included are: (l) an isolated mucleic acid comprising: (a) at least 80% sequence identity to a nucleotide sequence in the amorphism of the any of 15 fully defined sequence or full-length coding sequence with any of 15 fully defined sequences of 957-3441 base pairs, given in the specification; or (c) at least 80% sequence identity to a full-length coding sequence of a nucleotide sequence of 40% sequence identity to a full-length coding sequence of a collection of a collect
 New isolated PRO polypeptide and encoding nucleic acid, useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS, cancer, atherosclerosis, inflammatory disease and diabetes.
 Human; PRO; secreted protein; transmembrane protein; anti-HIV; cytostatic; antiarteriosclerotic; antiinflammatory; antidiabetic; cardiant; AIDS; acquired immunodeficiency syndrome; cancer; atherosclerosis; inflammatory disease; diabetic complication; cardiac injury; organ failure.

cell comprising the vector which, when cultured under conditions suitabl for expression of the PRO polypeptide, produces the PRO protein; (4) a chimeric molecule comprising PRO fused to a heterologous amino acid sequence; and (5) an anti-PRO antibody. The methods and compositions of the present invention are useful for the diagnosis and treatment of disorders associated with the PRO polypeptide, such as AIDS (acquired immunodeficiency syndrome), cancer, atheroscierosis, inflammatory disease, diabetic complications, cancer, autheroscierosis, inflammatory antibodies can also be used in the different screening, therapeutic and biological assays. The present sequence represents a PRO protein

```
The invention relates to a human secreted and transmembrane polypeptide (PRO) and the polynucleotide encoding it. The PRO polypeptide or polynucleotide is useful in pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting or treating cancers, inflammatory diseases, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, acquired immunodeficiency syndrome (AIDS) and diabetic complications in mammals, e.g. humans, dogs, cats, cattle, horses, sheep, pigs, goats or rabbits. The sequences are also useful in biotechnological and medical research and in various polypeptides of the invention

 transmembrane polypeptides) and the PRO polymucleotides encoding them. The invention also relates to a method for stimulating the release of two invention also relates to a method for stimulating the release of two invention also relates to a method for stimulating the release of the blood with a sequence of the invention, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO polypeptide and a method for detecting the presence of a tumour in a mammal. The polypeptides and polymucleotides are useful for the manufacture of a medicament for diagnosing or treating a tumour in a mammal. Sequences ABUBSSPR represent human PRO polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html
 32 SAAALIPTGGGQNLFTKDVTVIEGEVATISCQVNKSDDSVIQLINPNRQTIYFRDFRPLK 91
 Desnoyers L, Goddard A, Godowski PJ, Gurney AL; stanabe CK, Wood WI, Zhang Z;
 Three hundred and five nucleic acids encoding PRO polypeptides, useful for the manufacture of a medicament for diagnosing or treating tumor.

The invention relates to three hundred and five nucleic acids encoding CC PRO polypeptides (secreted and transmembrane), sequences 80% identical to them, or encoding a PRO polypeptide lacking its associated signal peptide.

Or an extracellular domain of the PRO polypeptide, with or lacking its associated signal peptide. Also included are the encoded PRO proteins, CRO produce PRO proteins, a chimaraic molecule comprising the PRO proteins), a chimaraic molecule comprising the PRO proteins), a chimaraic molecule comprising the PRO proteins), a chimaraic molecule comprising the PRO proteins), a chimaraic molecule comprising the PRO proteins), a chimaraic molecule comprising the PRO proteins), a method for stimmlating the release of tumor necrosis factor alpha (TNR-alpha) from human blood (by contacting the blood with PRO1079, PRO4313), a method for stimmlating the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO6029 polypeptide, or anti-PRO antibody is useful for preparing a method for detecting the presence of tumour in a mammal and an oppose. The PRO polypeptide or anti-PRO antibody is useful for preparing a medicament for treating a condition that is responsive to the PRO as hybridisation probes in chromosome and gene mapping, or in generating action and cell and gene mapping, or in generating action and gene mapping, or in generating actions to generate transgenic animals or knockout contaction, to generate transgenic animals or knockout contacting the presence of atumour in a mammal, and cell the presence of atumour in a mammal, and cell the presence of atumour in a mammal, and cell ferrentiation of chodrocyte cells, in gene therapy. The PRO polypeptides and nucleic acid molecules are also useful for detecting the presence of atumour in a mammal, and cell ferrentiation of chodrocyte cells, in gene therapy, or as molecular markers for protein evidenting the cells in prepared the presence of a tumour necrosis factor-alpha from human blood, in gene cells in purposes. The an
 Three hundred and five nucleic acids encoding PRO polypeptides, useful in gene therapy, chromosome identification, tissue typing, and for detecting the presence of tumor in a mammal.

The invention discloses human nucleic acids encoding secreted and transmembrane (PRO) polypeptides. Also disclosed is an antibody that tensmembrane (PRO) polypeptide, a method for stimulating the release of tumour necrosis factor alpha (TNF-alpha) from human blood by contacting the blood a PRO polypeptide, a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO polypeptide, a method for detecting the presence of a tumour in a mammal and an oligonucleotide probe derived from any of the PRO nucleotide sequences. The nucleotide sequences are useful as probes, no chromosome and gene mapping, in generating antisense RNA and DNA, in preparing PRO polypeptides by recombinant techniques and in gene therapy (e.g. for replacement of defective gene). The PRO polypeptides are useful as molecular weight markers for protein electrophoreals purposes, for chromosome identification, as chromosome markers, as therapeutic agents, for stimulating the release of TNF-alpha from human blood, for stimulating the proliferation or differentiation of chondrocytes and detecting the proliferation or differentiation of chondrocytes and detecting the presence of a tumour. The PRO polypeptides and nucleic acids may also be used diagnostically for tissue typing. The sequences presented in ABU67406-ABU67710 are the PRO polypeptides of the invention

The invention relates to three hundred and five nucleic acids encoding PRO polypeptides (secreted and transmembrane). Methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of tumours, such as adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumours. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human CDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The present sequence represents a human PRO polypeptide of the invention
 transmembrane
 Three hundred and five nucleic acids encoding secreted and transmembrane PRO polypeptides, useful for the diagnosis, prevention and/or treatment of tumors, such as adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumors.

The invention relates to an isolated nucleic acid encoding a secreted/
transmembrane polypeptide (designated as PRO proteins). 15 PRO
CC polypeptides and their encoding polymuclectides are disclosed. Also
cincluded are a vector comprising the PRO nucleic acid, a host cell
comprising the vector, a process for producing a PRO polypeptide (by
CC culturing the host cell under conditions for the expression of the PRO
colypeptide, and recovering the PRO polypeptide (by
CC culturing the host cell under conditions for the expression of the PRO
polypeptide, and recovering the PRO polypeptide (by
CC the PRO polypeptides a chimaeric molecule comprising PRO fused to a
heterologous amino acid sequence and an antibody which specifically binds
CC the PRO polypeptides, a chimaeric molecule comprising PRO fused to a
heterologous amino acid sequence and an antibody which specifically binds
CC the PRO nucleotide sequences are useful as hybridisation probes,
in chromosome and gene mapping, in generating sense and antisense RNA or
DNA, in generating transgenic or knock-out animals which can be used in
the development and screening of therapeutically useful reagents, and in
CC gene therapy. The polypeptides may be used as molecular weight markers
CC for procein alectrophoresis purposes. The PRO polypeptides and nucleic
Cacids may also be used for chromosome identification, and tissue typing.
CC syndrome. Other PRO proteins are variously implicated in immune
CC syndrome. Other PRO proteins are variously implicated in immune
CC injury, infertility, birth defects, premature aging, cardiac injury,
ADD, cancer and diabetic complications. The present sequence represents

 Human, gene therapy, chondrocyte stimulation, TNF-alpha release, chondrocyte proliferation; chondrocyte differentiation; tumour detection;
 91
 The invention describes a novel isolated PRO polypeptide. The methods a compositions of the present invention are useful for the diagnosis and treatment of disorders such as inflammatory disease, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, diaberic complications and mutations in general. This is the amino acid sequence of a novel human secreted PRO protein

The invention describes a novel isolated PRO polypeptide. The PRO polypeptide or anti-PRO antibody is useful for preparing a medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody. The PRO nucleotide sequences are useful as hybridisation probes in chromosome and gene mapping, or in generating antisense RNA and DNA. PRO nucleic acids are also useful in preparing PRO polypeptides, in assays to identify other proteins or molecules involved in binding
 New secreted and transmembrane PRO polypeptides and nucleic acids, useful in gene therapy, chromosome identification, tissue typing, for detecting the presence of tumor in a mammal, or as hybridization probes in gene mapping.

 reaction, to generate transgenic animals or knockout animals, which in turn are useful in the development and screening of therapeutically useful reagents, for chromosome identification, and tissue typing. The PRO polypeptides and nucleic acid molecules are also useful for detecting the presence of tumour in a mammal, stimulating proliferation or defection of chondrocyte cells, stimulating the release of tumour necrosis factor-alpha from human blood, in gene therapy, or as molecular weight markers for protein electrophoresis purposes. The anti-PRO antibodies may be used in diagnostic assays for PRO, or for the affinity purification of PRO from recombinant cell culture or natural sources. This is the amino acid sequence of a novel human secreted and transmembrane PRO polypeptide

This invention relates to a nucleotide sequence encoding an isolated secreted and/or transmembrane protein. The nucleotide sequences of the invention may have antiinflammatory, antiarteriosclerotic, cardiant, anti-infertility, anti-HIV, cytosetatic and antidiabetic activities and may be used in gene therapy. The nucleic acids and polypeptides are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, AIDS, cancer, of diabetic complications. The nucleic acids are useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA probes, in the polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing. The present sequence represents a protein encoded by the nucleic acids of the

The invention discloses human nucleic acids encoding secreted and transmembrane (PRO) polypeptides, with or without their associated signal CC transmembrane (PRO) polypeptides, with or without their associated signal CC peptide. Also disclosed is an antibody that specifically binds to the PRO polypeptide, a method for stimulating the release of tumour necrosis differentiation of chodrocyte cells by contacting the blood with a CC differentiation of chodrocyte cells by contacting the cells with a PRO CC polypeptide, a method for detecting the presence of a tumour in a mammal an oligonucleotide probe derived from any of the PRO nucleotide cand an oligonucleotide probe derived from any of the PRO nucleotide and gene mapping, in generating antiense RNA and DNA, in preparing PRO polypeptides by recombinant techniques and in gene therapy (e.g. for replacement of defective gene). The PRO polypeptides are useful as concented defective gene). The PRO polypeptides are useful as concented defective gene). The PRO polypeptides are useful as concented in the proliferation or differentiation of chondrocytes and concentrating the presence, prevention and/or treatment of a tumour, such as adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumour. The PRO polypeptide and nucleic acids may also be used diagnostically concentration. Note: The sequence data for this patent can also be obtained concentrated by an encoded concentration or directly from USPTO at

(ABR69963-ABR70267) and nucleic acids encoding them (ACC90994-ACC91298).

The invention also relates to sequences at least 80% identical to the PRO nucleic acid and polypeptide sequences of the invention, recombinant vectors and host cells comprising a PRO nucleic acid, a method for the recombinant production of a PRO polypeptide, antibodies against a PRO polypeptide, and fusion proteins comprising a PRO polypeptide. Nucleic acids encoding PRO polypeptides of the invention were initially identified via homology screening using consensus sequences based on the extracellular domain sequences from known secreted proteins. Human cDNA libraries containing sequences from known secreted proteins. Human cDNA cligonucleotides based on the consensus sequences, and cDNA clones were significated and characterised. The PRO polypeptides are useful for stimulating release of tumour necrosis factor-alpha (TNF-alpha) from characterised which have used in the treatment of conditions in which enhanced TNF-alpha release would be beneficial. They are also useful for enhanced TNF-alpha is a man allowed and may thus be used in the treatment of conditions in which enhanced TNF-alpha is a man allowed and may thus be used in the treatment of conditions in which enhanced TNF-alpha is release would be beneficial. They are also useful for enhanced the proteins and proteins and proteins and proteins and proteins and proteins and proteins and proteins and proteins and proteins and proteins and proteins are also useful for enhanced the proteins and proteins
 therapeutically useful compounds. Sequences ABR69963-ABR70267 represent the human PRO secreted/transmembrane polypeptides of the invention. Note The sequence data for this patent is also available in electronic format from USPTO at sequate.uspto.gov/sequence.html
 invention relates to human PRO secreted/transmembrane polypeptides
 Gurney AL;
 PRO polypeptides, for genetic analysis of individuals with genetic disorders, and for generating either transgenic animals or knock-out animals which are useful in the development and screening of
 ಥ
 New secreted and transmembrane PRO polypeptide useful in preparing medicament for treating a condition that is responsive to the PRO polypeptide or anti-PRO antibody.

transmembrane polypeptides and interactive secretaries the interactive control of the polymerlectides encoding them. The invention also relates to an antibody that specifically binds to a PRO polypeptide a method for stimulating the release of tumour necrosis factor alpha (TMF-alpha) from human blood by contacting the blood with a PRO polypeptide and a method for stimulating the proliferation or differentiation of chondrocyte cells by contacting the cells with a PRO polypeptide. The polypeptides and polymucleotides are useful for detecting the presence of a tumour, such as an adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumour, and for treating such tumours. The polymucleotides are useful as phyridisation probes, in chromosome and gene mapping and in generating antisense RNA or DNA. The polypeptides are useful in tissue typing acceptable should be acceptable to the search human PRO polypeptides of the invention. Note: The sequence data for this patent is also available in electronic format from
 Three hundred and five nucleic acids encoding secreted and transmembrane polypeptides, designated as PRO, useful for detecting the presence of, or treating tumor, e.g. adrenal, lung, colon, breast, prostate, rectal, cervical or liver tumor.
 Godowski PJ, Gurney AL;
 The invention relates to human PRO polypeptides (secreted and
